

Cogito Elevator Control

Restricting access to particular floors on schedule, locking down elevators or making them accessible without restriction are part and parcel of our true elevator control. From a reader installed inside of the

elevator cab a cardholder can enable all of the buttons to allowed floors, and after floor selection button press to disable activated buttons preventing piggy-back access to other floors. Multiple cardholders can make their selections during the trip.

Cogito can communicate with elevator controller via programmable ASCII or input/output interface. Architecture employed makes it easy to add visitor access functionality to existing systems.

Permissions are easily configured in “Access Group” screen.

- Up to 256 floors per cab
- Control individual or banks of elevators
- Floor-groups for easy access configuration
- HID VertX V1000 controllers and V100 and V300 interface panels
